

I received a question on the [EzPublish Section of Open Source Discussion Blog](#) the other day:

step 1: first i created blog and than inside i created blog post.

step 2: Now When i click the blog all the blog post are displayed in the particular area.

step 3: At the same time right side dispalyed Tags,archive,Calendar.

These are the things happened defaultly,

here my doubt was

1)how it is happen

2)where it is happen

3)how to add new block in the right side

*Thanks,
Magesh*

My answer after looking through the source:

Yes the contents displayed from the blog happens by default.

1) How it happens?

This is handle by the template engine. The blog is a content object. When you are in the view where you see all its blog post, you are actually viewing the the **FULL** version of the content object.

2)Where is the location of the template used for generating this view?

`extensionezwebindesignezwebinoverrideemplatesfullblog.tpl`

3)How to ad new block to the right side?

First thing first, we need to understand the display of this particular content object view is independent of the EzFlow extension.

This is actually part of the EzWebin extension.

To answer your question on how to add another block on the right. We look at this line in file: *extensionezwebin*
designezwebinoverrideemplatesfullblog.tpl

The line: `{include uri='design:parts/blog/extra_info.tpl' used_node=$node}`

The location of this file is here: *extensionezwebindesignezwebintemplatespartsblogextra_info.tp*
/

To add a new block for example **some_more_info**

add this line : `{include uri='design:parts/blog/some_more_info.tpl'}` after `{include uri='design:parts/blog/calendar.tpl'}`

EzPublish Blog

Next create a file at location *extensionezwebindesignezwebintemplatespartsblog* by the name of **some_more_info**.
re_info *.tpl*

simply input your contents in the block in the file (**some_more_info**.*tpl*) and save.

Chances are your system cache might not show the updated view after you have done this step, so you need to clear your cache after you are done.

To clear cache

1. login to your administrative backend.
2. Go to setup
3. Click on button **clear all cache**

Hope this is of help to you.

I will talk more about how to use template functions and operators to manipulate the interface in a later article.

Have a good day.
